How to Use This Journal

The art of patient cultivation, one record at a time

WHY KEEP A BONSAI JOURNAL?

Bonsai is a relationship measured in decades, not days. A journal captures the slow unfolding of each tree's story — when you pruned, how it responded, what the weather did, and how your skills grew alongside your collection. Without records, years of learning fade. With them, every tree becomes a teacher.

Guidelines

- 1. Log on the same day.** Record work immediately after performing it. Details like soil moisture level, exact branch angles, and fertilizer ratios fade quickly from memory.
- 2. Photograph before and after.** A photo from the same angle each season reveals growth that is invisible day to day. Note the photo date in your journal entry.
- 3. Track the seasons.** Bonsai care follows nature's calendar. Record when buds break, when fall color peaks, and when your tree goes dormant. Patterns emerge over the years.
- 4. Note your mistakes honestly.** A dead tree teaches more than a healthy one. Record what went wrong — overwatering, wrong soil, late pruning — so you never repeat it.
- 5. Plan before you cut.** Sketch the tree and draw your intended design before pruning. Every cut is permanent. A drawing helps you see the future silhouette.

Common Bonsai Species

Popular species with care characteristics

SPECIES	TYPE	LIGHT	WATER	HARDINESS	KEY NOTES
Juniper	Evergreen	Full Sun	Med	Hardy	Outdoor. Pinch growth, do not cut. Needs winter dormancy.
Chinese Elm	Semi-Dec.	Full Sun	Med-High	Hardy	Great for beginners. Forgiving of mistakes. Indoor or outdoor.
Ficus (Retusa)	Tropical	Bright	High	Tender	Indoor. Loves humidity. Aerial roots. Cannot freeze.
Japanese Maple	Deciduous	Part Sun	Med	Hardy	Protect from hot afternoon sun. Stunning fall color.
Pine (Black/White)	Evergreen	Full Sun	Low-Med	Hardy	Candle pruning in spring. Needs cold winter dormancy.
Azalea (Satsuki)	Flowering	Part Sun	High	Semi-Hardy	Acidic soil. Stunning blooms. Prune after flowering.
Jade (Portulacaria)	Succulent	Bright	Low	Tender	Indoor. Drought tolerant. Easy for beginners. Thick trunk.
Trident Maple	Deciduous	Full Sun	Med	Hardy	Excellent nebari (root flare). Fast growing. Good for forests.
Bougainvillea	Tropical	Full Sun	Low-Med	Tender	Vibrant blooms. Thick trunks. Loves heat. Protect below 40°F.
Cypress (Bald)	Deciduous	Full Sun	High	Hardy	Loves water. Great for swamp styles. Feathery foliage.
Boxwood	Evergreen	Part-Full	Med	Hardy	Dense foliage. Great for clip-and-grow. Forgiving.
Wisteria	Deciduous	Full Sun	High	Hardy	Cascading flower racemes. Needs strong root system. Heavy feeder.
Serissa	Evergreen	Bright	Med	Semi-Hardy	"Tree of a Thousand Stars." Tiny white flowers. Sensitive to changes.
Olive	Evergreen	Full Sun	Low-Med	Semi-Tender	Drought tolerant. Beautiful bark. Hardy in Mediterranean climates.
Zelkova	Deciduous	Full Sun	Med	Hardy	Classic broom style. Fine twigging. Golden fall color.

Type: Evergreen retains foliage. Deciduous loses all leaves. Semi-Dec. partially retains. Tropical needs indoor protection. | Light: Full Sun = 6+ hrs direct. Part Sun = 4-6 hrs. Bright = bright indirect. | Hardiness: Hardy = freezing OK. Semi-Hardy = light frost only. Tender = protect below 40°F.

Seasonal Pruning Calendar

When to prune, wire, and work on each species

SPRING		SUMMER	FALL	WINTER
SEASON	DECIDUOUS	EVERGREEN (JUNIPER/PINE)		TROPICAL
Spring	Best time for structural pruning. Prune before buds open. Repot when buds swell. Wire new growth.	Pine: candle pruning. Juniper: pinch new growth. Major styling OK. Repot late spring.		Active growth. Prune and wire freely. Repot as new growth starts.
Summer	Defoliation (maples). Pinch new growth. Light pruning only. Do not wire heavily in heat.	Pinch and trim. Wire branches. Avoid heavy pruning. Water vigilantly.		Peak growth season. Heavy pruning OK. Fertilize regularly. Watch for pests.
Fall	Light pruning only. Remove dead growth. No wiring — branches are brittle. Apply wire to refine only.	Light maintenance pruning. Good time for jin/shari work. Stop fertilizing.		Bring indoors before nights drop below 50°F. Reduce watering. Stop pruning.
Winter	Dormant. Structural pruning of bare branches. Major pruning cuts heal slow but safe. Protect from frost.	Dormant period. Minimal work. Protect from freezing winds. Do not prune.		Indoor care. Grow lights may be needed. Reduce water. No pruning or repotting.

GOLDEN RULES OF PRUNING

1. Prune to enhance the tree's natural character, not to force an unnatural shape.
2. Never remove more than 1/3 of foliage in a single session.
3. Always cut to a node or branch collar. Flush cuts leave wounds.
4. Use sharp, clean tools. Disinfect between trees.
5. Seal large cuts with cut paste on deciduous trees to prevent dieback.

Watering Guide

The most critical skill in bonsai

THE GOLDEN RULE

Water when the soil surface begins to feel dry — not on a fixed schedule. Soil, weather, species, pot size, and season all change how fast water is used. Learn to read each tree individually.

How to Water Properly

- 1. Check before watering.** Push your finger 1/2 inch into the soil. If it feels moist, wait. If it feels dry, water thoroughly. The surface can look dry while the root ball is still wet.
- 2. Water twice.** Water the entire surface until water runs from the drainage holes. Wait a minute, then water again. The first pass moistens the surface; the second penetrates the root ball.
- 3. Use a fine rose.** A watering can with a fine rose attachment prevents soil erosion and ensures even distribution. Never blast the soil with a hose nozzle.
- 4. Morning is best.** Water in early morning so excess moisture evaporates during the day. Evening watering can promote fungal problems. Avoid midday watering in summer (hot roots).

SIGNS OF TROUBLE

SYMPTOM	LIKELY CAUSE	ACTION
Yellow leaves falling	Overwatering — roots suffocating	Check drainage. Reduce watering frequency.
Crisp brown edges	Underwatering or wind burn	Water more frequently. Add humidity tray.
Wilted but soil wet	Root rot from chronic overwatering	Repot. Trim dead roots. Fresh soil.
Sudden leaf drop	Shock: temperature, location, or watering change	Stabilize conditions. Do not fertilize.

Remember: *There is no watering schedule that works every day. A tree may need water twice a day in summer heat and once a week in winter. Always check the soil.*

Soil Mixtures & Repotting

The foundation of tree health

COMPONENT	FUNCTION	NOTES
Akadama	Moisture retention	Japanese clay. Breaks down over 1-2 years, signaling repot time. Gold standard.
Pumice	Drainage / aeration	Light volcanic rock. Holds some water and air. Essential component.
Lava Rock (Scoria)	Drainage / structure	Provides aeration and structural stability. Does not break down.
Kanuma	Acidic (azaleas)	Japanese acidic soil. Ideal for azaleas and other acid-loving species.
Perlite	Budget alternative	Accessible drainage additive. Lighter than pumice. Good for beginners.
Bark fines	Organic matter	Retains moisture and nutrients. Use sparingly in bonsai mixes.

RECOMMENDED MIX RATIOS

SPECIES TYPE	AKADAMA	PUMICE	LAVA ROCK
Conifers (Pine/Juniper)	1 part	1 part	1 part
Deciduous (Maple/Elm)	2 parts	1 part	1 part
Tropical (Ficus/Jade)	1 part	1 part	1 part + bark
Azalea	—	1 part	Kanuma 2 parts

WHEN TO REPOT

Frequency: Young/fast-growing trees every 1-2 years. Mature trees every 3-5 years. Conifers less frequently than deciduous.

Timing: Late winter / early spring, just before buds break. Tropicals: mid-summer when actively growing.

Signs: Water drains slowly. Roots circling the pot. Akadama breaking into mush. Tree lifting from pot.

Process: Remove 1/3 to 1/2 of old soil. Trim 1/3 of roots. Repot with fresh mix. Water thoroughly. Keep in shade 2 weeks.

Wiring & Styling Guide

Shaping branches with patience and precision

THE PURPOSE OF WIRING

Wiring allows you to bend and position branches precisely. Unlike pruning (which removes material), wiring reshapes what already exists. It is the primary technique for creating the artistic form of your bonsai.

Wire Selection

- Anodized aluminum:** Easier for beginners. Softer, reusable. Good for deciduous and tropical species.
- Annealed copper:** Hardens when bent. Stronger hold for a thinner gauge. Preferred for conifers.
- Rule of thumb:** Use wire that is about 1/3 the thickness of the branch you are wiring.

Application Steps

1. Anchor the wire by pushing the end deep into the soil at the trunk base.
2. Wrap at a 45-degree angle, evenly spaced. Keep wire firm but not crushing the bark.
3. Wire in the direction you intend to bend. Clockwise wrap = clockwise bend.
4. Use both hands to bend. Support the branch on both sides of the wire.
5. Check weekly. Remove before the wire cuts into the bark (bark biting).

WHEN TO REMOVE WIRE

SPECIES	TYPICAL DURATION	WATCH FOR
Fast-growing (Maple)	2-4 months in growing season	Bark swells quickly. Check weekly.
Juniper	6-12 months	Slow to set. Be patient.
Pine	6-18 months	Very slow. Can stay on through dormancy.
Tropical (Ficus)	1-3 months	Fast growth. Watch for marks.

Caution: Wire marks are permanent scars on the bark. It is always better to remove wire too early than too late. If in doubt, remove it and rewire later.

Common Pests & Diseases

Identify and treat problems early

PROBLEM	SIGNS	TREATMENT
Aphids	Clusters of tiny green/black insects on new growth. Sticky sap (honeydew) on leaves below.	Spray with water. Neem oil. Insecticidal soap. Encourage ladybugs.
Spider Mites	Fine webbing between leaves. Yellow stippling on foliage. Worse in dry heat.	Spray underside of leaves with water daily. Neem oil. Increase humidity.
Scale	Brown bumps on branches and leaves. Sticky residue. Ants farming them.	Scrape off manually with toothpick. Systemic insecticide for severe cases.
Mealybugs	White cottony masses in leaf joints and branch crotches.	Remove with alcohol swab. Neem oil spray. Systemic for persistent cases.
Fungus Gnats	Small black flies around soil. Larvae in topsoil damaging fine roots.	Allow surface to dry between watering. Yellow sticky traps. BTI drench.
Powdery Mildew	White powdery spots on leaves. Worse in high humidity / poor airflow.	Improve airflow. Remove affected leaves. Fungicide spray. Reduce humidity.
Root Rot	Soft black roots. Foul smell. Tree declining despite adequate water.	Repot immediately. Remove all dead roots. Fresh gritty soil. Reduce water.
Leaf Burn	Brown crispy leaf edges or tips. Not a pest — environmental.	Protect from hot afternoon sun. Check watering. Provide wind protection.

PREVENTION

- Inspect trees weekly, especially new growth and leaf undersides.
- Good airflow between trees. Do not crowd.
- Quarantine new trees for 2 weeks before adding to display.
- Clean tools between trees with rubbing alcohol.
- Healthy trees resist pests better — proper watering and feeding is the best defense.

Classical Bonsai Styles

The five foundational forms and their variations

FORMAL UPRIGHT (CHOKKAN)

Perfectly straight trunk, tapering from base to apex. Branches alternate left-right-back. The most challenging form. Best: Pine, Juniper, Maple.

INFORMAL UPRIGHT (MOYOGI)

Curving S-shaped trunk. Most popular style. Natural look. Branches on outside of curves. Best: Most species.

SLANTING (SHAKAN)

Trunk leans at 60-80 degrees. Root mass anchors the leaning side. Suggests wind or cliff-side growth. Best: Pine, Juniper, Elm.

CASCADE (KENGAI)

Trunk grows downward below the pot rim, mimicking a tree on a cliff. Needs a deep pot. Best: Juniper, Pine, Cotoneaster.

SEMI-CASCADE (HAN-KENGAI)

Trunk extends horizontally then cascades but does not go below the pot base. Less dramatic than full cascade. Best: Juniper, Flowering species.

LITERATI (BUNJINGI)

Tall slender trunk with minimal foliage at top. Elegant and sparse. Inspired by Chinese scholar paintings. Best: Pine, Juniper.

BROOM (HOKIDACHI)

Straight trunk branching into a fan-shaped canopy at the top. Resembles a broom. Best: Zelkova, Elm, Maple.

FOREST (YOSE-UE)

Multiple trees planted together to create a miniature forest. Odd numbers (3, 5, 7) look most natural. Best: Maple, Elm, Larch.

ROOT-OVER-ROCK (ISHITSUKI)

Roots grow over and grip a rock, then descend into soil. Dramatic and ancient look. Best: Ficus, Maple, Juniper.

WINDSWEPT (FUKINAGASHI)

All branches grow in one direction, as if shaped by constant wind. Evokes struggle and survival. Best: Juniper, Pine.

These forms are guides, not rules. The best bonsai reflects the natural character of the tree and the vision of the artist. Study mature trees in nature for inspiration.

Seasonal Care Calendar

Plan and track recurring tasks by season

SPRING		SUMMER	FALL	WINTER
SEASON	KEY TASKS			DONE?
Spring	Repot deciduous when buds swell. Structural pruning. Apply wire. Start feeding (low nitrogen first). Protect from late frost.			☐
Spring	Pine: decandle. Juniper: pinch growth. Check for aphids on new growth. Move outdoor trees to full sun.			☐
Summer	Water 1-2x daily in heat. Defoliate maples (mid-summer). Fertilize regularly. Shade sensitive species from afternoon sun.			☐
Summer	Watch for spider mites. Trim long shoots. Apply wire to summer growth. Tropicals: peak growing season, prune hard.			☐
Fall	Stop nitrogen fertilizer (switch to 0-10-10 for hardening). Remove wire before dormancy. Clean dead leaves.			☐
Fall	Light pruning only. Jin and shari work on junipers. Bring tropicals indoors. Prepare winter shelter for hardy trees.			☐
Winter	Structural pruning of bare deciduous branches. Major branch removal. Protect pots from freezing. Minimal watering.			☐
Winter	Plan next year's design changes. Order supplies (soil, wire, pots). Study and sketch. Inventory tool condition.			☐

Patience Is the Greatest Tool

The best time to shape a bonsai was twenty years ago.

The second best time is today.
