How to Use This Journal

Document your fermentation journey, batch by batch

WHY KEEP A FERMENTATION JOURNAL?

Fermentation is both art and science. A journal turns experiments into reproducible recipes. By recording ingredients, temperatures, timing, and outcomes, you build a personal reference that transforms trial and error into expertise. Your journal becomes your own fermentation cookbook.

Tips for Better Fermentation

- 1. Weigh everything.** Fermentation lives or dies by ratios. Use a kitchen scale, not measuring cups. Record weights in grams for precision and reproducibility. Salt percentage is the single most important variable.
- 2. Temperature matters.** Most ferments thrive between 65-75°F (18-24°C). Too cold and fermentation stalls; too warm and it races, producing off-flavors. Note your ambient temperature daily.
- 3. Record observations daily.** In the first week, check every day. Note bubbles, color changes, smell, texture, and any mold. Patterns emerge over multiple batches that you cannot see from memory.
- 4. Label every jar.** Write the ferment name, start date, and batch number on each vessel. When you have five jars going at once, memory is not enough. Use glass-safe markers or masking tape labels.
- 5. Trust your senses.** A healthy ferment smells sour, tangy, and pleasant. If something smells putrid, rotten, or looks fuzzy (mold with green/black/white growth), discard it. When in doubt, throw it out.

Safety Note: While fermentation is one of the oldest and safest food preservation methods, proper hygiene is essential. Use clean equipment, filtered water (chlorine inhibits fermentation), and non-iodized salt. If you have health concerns, consult a healthcare professional before consuming fermented foods.

Salt & Brine Guide

The most critical ratio in fermentation

FERMENT TYPE	SALT %	SALT PER 1KG VEG	SALT PER 1L WATER	NOTES
Sauerkraut	2.0%	20g	N/A (massaged)	Salt massaged into cabbage
Kimchi	2.5-3.0%	25-30g	N/A (soaked)	Brine soak then paste
Pickles (cucumber)	3.5-5.0%	N/A	35-50g	Brine pour-over method
Hot Sauce / Pepper	3.0-5.0%	30-50g	30-50g	Brine or mash method
Carrots / Radish	2.5-3.5%	N/A	25-35g	Brine pour-over
Kombucha	N/A (sugar)	N/A	50-100g sugar	Sugar feeds SCOBY, not salt
Sourdough	1.5-2.5%	Baker's pct	N/A	% of flour weight
Miso / Bean Paste	8-12%	80-120g	N/A	High salt, long ferment

HOW TO CALCULATE BRINE:

Brine % = (salt weight ÷ water weight) × 100. For a 3.5% brine: 35g salt per 1000g (1L) water. Always use weight, not volume. A tablespoon of coarse salt weighs very different from a tablespoon of fine salt.

Salt choice: Use non-iodized salt (sea salt, kosher, pickling salt). Iodine inhibits the bacteria that make fermentation work. Avoid salt with anti-caking agents when possible.

Types of Fermentation

From vegetables to vinegars — know your ferments

LACTO-FERMENTATION (VEGETABLES)
Sauerkraut • Kimchi • Pickles • Salsa • Hot Sauce • Fermented Carrots • Chutney • Curtido • Giardiniera

KOMBUCHA & FERMENTED TEA
Kombucha (SCOBY) • Jun Tea (SCOBY + honey) • Kvass (beet) • Water Kefir (tibicos)

MILK KEFIR & YOGURT
Milk Kefir (grains) • Yogurt (thermophilic) • Viili • Filmjölkk • Caspian Sea Yogurt

SOURDOUGH & GRAIN FERMENTS
Sourdough Bread • Sourdough Pancakes • Injera • Dosa • Lactobacillus Rice Water

MISO, NATTO & TEMPEH
Miso (soybean/barley) • Natto • Tempeh • Doenjang • Douchi

VINEGAR & ALCOHOL
Apple Cider Vinegar • Wine Vinegar • Malt Vinegar • Mead • Country Wine

Most vegetable ferments use Lactobacillus bacteria (lacto-fermentation), which convert sugars to lactic acid. This acid preserves the food and creates the characteristic tangy flavor. Kombucha and vinegar use a different process involving yeast and acetic acid bacteria.

pH & Fermentation Timeline

Know when your ferment is ready

The pH Scale for Fermentation

Below pH 4.0: Safe zone. Lactic acid bacteria dominate, harmful organisms cannot survive. Most vegetable ferments are ready at pH 3.3-3.8.

pH 4.0-4.6: Transition zone. Ferment is progressing but not yet at full preservation. Continue fermenting.

Above pH 4.6: Caution. Not acidic enough for safe room-temperature storage. Do not can or seal at this stage.

FERMENT TYPE	TARGET PH	TYPICAL DURATION	TEMPERATURE
Sauerkraut	3.3-3.8	2-4 weeks	65-72°F
Kimchi	3.5-4.0	3-7 days	65-72°F
Cucumber Pickles	3.0-3.5	1-2 weeks	68-75°F
Kombucha (1F)	2.5-3.5	7-14 days	72-80°F
Kombucha (2F)	2.5-3.0	2-5 days	72-80°F
Milk Kefir	4.2-4.5	12-24 hrs	68-78°F
Sourdough (starter)	3.8-4.2	5-7 days establish	70-78°F
Hot Sauce	3.0-3.8	1-3 weeks	65-75°F
Miso	4.0-5.0	3-12 months	55-85°F
Apple Cider Vinegar	2.5-3.0	4-8 weeks	

When is it ready? Taste is your best guide. pH strips confirm safety. When the tanginess is to your liking and pH is below 4.0, move to cold storage (refrigerator) to slow fermentation. It will continue to develop flavor slowly in the fridge.

Safety Guidelines

Ferment confidently and safely

Mold vs. Kahm Yeast

White film on the surface is often kahm yeast (harmless). Fuzzy patches that are green, blue, black, or pink are mold — discard the batch. If unsure, smell: kahm yeast is mild and yeasty; mold smells musty.

Botulism Risk

Lacto-fermentation is inherently safe because the acidic environment prevents *Clostridium botulinum*. The danger is primarily in oil-packed or low-acid ferments. Always confirm pH is below 4.0 before long-term storage.

Temperature Control

Too warm (above 80°F/27°C) can cause rapid, off-flavor fermentation or allow unwanted bacteria to dominate. Too cold (below 60°F/16°C) slows fermentation to a crawl. Aim for 65-75°F for most vegetable ferments.

Equipment Hygiene

Wash jars, lids, weights, and tools with hot soapy water. No need to sterilize for fermentation (unlike canning), but everything must be visibly clean. Avoid scratched or chipped jars that harbor bacteria.

Water Quality

Chlorinated tap water can inhibit or kill fermentation bacteria. Use filtered, spring, or dechlorinated water (leave tap water uncovered for 24 hours to let chlorine dissipate).

Allergen Awareness

Fermented foods contain histamine and biogenic amines. People with histamine intolerance should introduce fermented foods gradually. Those with compromised immune systems, pregnant women, and young children should consult a healthcare provider.

Important: *This journal is a personal tracking tool and does not provide medical or food safety advice. Always use trusted recipes when starting out. If a ferment looks, smells, or tastes wrong, discard it.*
