How to Use This Logbook

Every find has a story worth preserving

WHY DOCUMENT YOUR FINDS?

Metal detecting is as much about the story as the object. Without records, details fade — where you found it, what settings you used, how deep it was. A logbook helps you identify patterns, return to productive sites, and preserve the provenance that gives each find meaning.

Tips for Better Records

- 1. Record GPS coordinates.** Mark every productive spot. Phone GPS apps work well. Future you will thank present you when you want to revisit a site that produced silver.
- 2. Note detector settings.** Record sensitivity, discrimination, frequency, and search mode. Different settings find different things. Knowing what worked helps you repeat success.
- 3. Log depth and signal.** Record the depth reading and the signal tone (high/low/choppy/whisper). This builds your ear for interpreting signals before you dig.
- 4. Photograph in situ.** Take a photo of the find in the hole before removing it. Context and soil conditions help with identification and dating.
- 5. Clean carefully.** Wrong cleaning destroys value. Note what method you used and the results. Coins especially need gentle handling.
- 6. Research your finds.** Spend time identifying items. Old coins, buckles, buttons, and relics all have stories. Note your research findings in the notes section.

Identifying Common Finds

What the ground gives up

METAL TYPE	SIGNAL	STONE	IDENTIFICATION TIPS
Copper	Med-High	Smooth	Green patina (verdigris). Pennies, old tokens, copper artifacts. Conductive, strong signal.
Silver	High	Bright	Tarnishes black/brown. Coins, jewelry. Very conductive. High-pitched bell tone. Rings clear.
Gold	Low-Med	Smooth	Does not tarnish. Rings, coins, nuggets. Low conductive. Often same VDI as foil/pulltab.
Brass	Med-High	Smooth	Yellow-gold color. Buckles, buttons, cartridge cases. Strong, smooth signal. Similar to copper.
Bronze	Med	Smooth	Brownish-green patina. Ancient coins, statues, relics. Harder than copper, similar signal.
Iron	Low	Choppy	Rusts red-brown. Nails, wire, tools, horseshoes. Usually discriminated out. Jumpy signal.
Steel	Low	Choppy	Silver-gray, rusts. Modern items, bottle caps, screws. Magnetic. Loud, jumpy, often double blips.
Lead	Low	Soft	Heavy, dull gray-white. Bullets, fishing weights, toy soldiers, pipes. Soft signal, heavy for size.
Aluminum	Med-High	Var.	Lightweight, silver. Pull tabs, cans, foil. Frustrating — reads similar to gold. Light for size.
Nickel	Low-Med	Smooth	Coins, buttons, buckles. Falls between foil and pull tab on VDI scale. Moderate conductivity.
Zinc	Med	Var.	Bluish-white. Modern pennies (1982+). Corrodes with white crust in soil. Crumbly if buried long.
Platinum	Low	Smooth	Silver-white. Rare — rings, jewelry. Very low conductivity. Similar to iron but smooth tone.

Signal = strength relative to other metals. Tone = audio character. VDI (Visual Discrimination Indicator) numbers vary by detector brand. Always dig questionable targets — the best finds often mask as trash.

Cleaning & Preservation

Handle with care — you only get one chance

THE GOLDEN RULE OF CLEANING

When in doubt, do nothing. A dirty, uncleaned coin with original patina is worth more than a cleaned, scratched one. Aggressive cleaning destroys collector value instantly. Research before you touch anything that might be valuable.

MATERIAL	SAFE?	CLEANING METHOD
Coins (Valuable)	NO	Do not clean. Leave patina intact. Professional conservation only. Handling reduces grade.
Coins (Common)	Soak	Soak in distilled water 24-48 hrs. Gently brush with soft toothbrush. Never scrub. Olive oil soak for stubborn dirt (days to weeks).
Silver	Gentle	Soak in water. Baking soda paste, gentle rub. Aluminum foil + baking soda bath removes tarnish. Never use abrasives on numismatic pieces.
Copper	Careful	Soak in olive oil for weeks. Soft brush only. Never remove green patina — it protects the surface and adds character.
Brass/Bronze	Careful	Soak in soapy water. Brass brushes only if heavily corroded. Preserve patina on relics. Wax to protect after cleaning.
Iron	Yes	Wire brush to remove loose rust. Soak in evaporust or molasses/water (weeks). Dry immediately. Coat with wax or oil to prevent re-rusting.
Lead	Gentle	Soak in water. Very soft — never scrub hard. White corrosion can be gently picked off. Handle carefully — lead is soft and toxic.
Gold	Yes	Rinse in water. Gentle dish soap. Gold does not tarnish. Ultrasonic cleaner is safe. Jewelry polish cloth for shine.
Relics (Unknown)	Research	Identify material first. When in doubt, leave dirt on. Photograph before cleaning. Consult experts for potentially historic items.

WHAT NEVER TO DO

DON'T	WHY
Polish coins	Removes toning and destroys numismatic value completely.
Use acids/chemicals	Eats metal surface. Vinegar, lemon juice, commercial cleaners all strip patina.
Scrub with abrasives	Creates hairline scratches that are visible under magnification. Lowers grade.
Tumble clean	Destroys surface detail on coins and delicate relics. Only for modern clad coins.
Use steel brushes	Scratches soft metals (copper, silver, lead). Embeds steel particles.

Permissions & Laws

Always hunt legally and ethically

THE MOST IMPORTANT RULE

Always get permission before detecting on private property. Trespassing is a crime. On public land, know the regulations before you go. When in doubt, ask the landowner or managing authority. A good reputation benefits every detectorist.

Private Property

1. Always get written permission from the landowner. A handshake is good, but a signed permission slip protects you.
2. Agree in advance on what happens to finds. Some landowners want a share. Be fair and build relationships.
3. Fill all holes. Leave the property as you found it. Carry a plug-cutting tool and learn proper digging technique.
4. Offer to share interesting finds or photos with the landowner. Good relationships lead to return visits and referrals.

Public Lands (United States)

5. National Parks, Monuments, and Historic Sites: Detecting is generally prohibited. Do not detect in these areas.
6. State Parks: Regulations vary by state. Many require permits. Check with the state parks department before detecting.
7. City and County Parks: Often allowed, but check local ordinances. Some cities prohibit detecting or require permits.
8. Schoolyards and sports fields: Usually public property but may have restrictions. Check with the school district or recreation department.
9. Beaches: Many public beaches allow detecting. Some states require permits. Research the specific beach rules — rules differ even within the same county.

Ethical Considerations

10. Report significant historical finds to local historians or museums. Context matters for understanding history.
11. Remove trash you dig. Every pull tab you take out makes the site cleaner for the next visit.

12. Respect archaeological sites. If you find something potentially significant, photograph in place, note location, and contact professionals.

Detector Settings Guide

Understanding your machine

SETTING	RANGE	WHAT IT DOES
Sensitivity	1-10 / Max	Detection depth and signal strength. Higher = deeper but more noise/interference. Lower in mineralized soil or near power lines.
Discrimination	0-100	Filters out unwanted metals (iron, foil). Higher = rejects more but may miss good targets. Low discrimination = dig everything.
Ground Balance	0-100	Tunes out mineralization in soil. Manual or auto. Essential in mineralized ground. Wrong GB = reduced depth and false signals.
Threshold	Off-Max	Background hum. Set barely audible. Changes in hum indicate targets. Key for small/deep targets in quiet hunting.
Tone ID	1-4 / Multi	Number of audio tones for different metals. More tones = more info but harder to learn. Multi-tone gives pitch per target ID number.
Frequency	3-100 kHz	Low (5 kHz) = depth, silver, high conductors. High (18+ kHz) = small gold, low conductors, separation in trash. Multi-frequency does both.
Notch Filter	On/Off	Rejects specific target ID categories while accepting others. Useful to notch out pull tabs while keeping nickel/gold range.
Pinpoint Mode	Toggle	Non-motion mode that locates exact target position. Signal gets louder as coil centers over target. Use before digging.
Search Mode	Presets	Pre-configured settings (Coins, Jewelry, Relic, Beach, All Metal). Good starting point. Customize as you learn your machine.

VDI NUMBER GUIDE (APPROXIMATE — VARIES BY DETECTOR)

VDI RANGE	LIKELY TARGET
-10 to 0	Iron (nails, wire, horseshoes)
0 to 15	Foil, tiny gold nuggets, small bits
15 to 25	Pull tabs, nickels, small gold rings
25 to 40	Aluminum, screw caps, large gold
40 to 60	Pennies (copper), small brass, shotgun shells
60 to 80	Dimes, quarters, halves, silver coins
80 to 99	Large silver, copper, brass buttons, silver dollars

Pro Tip: The best detectorists dig everything in new sites. Once you understand the trash pattern, start using discrimination. Silver and gold can hide in the same VDI range as trash — trust your ears and dig the smooth, repeatable signals.
