How to Use This Log Book

Your personal record of every dive

WHY KEEP A DIVE LOG?

A dive log is more than a record — it is proof of your experience, a tool for tracking your air consumption and comfort at depth, and a passport to deeper adventures. Dive operators worldwide require log books as evidence of your certification level and dive count. Your log tells the story of your underwater journey.

What to Record Every Dive

- 1. Log immediately.** Record depth, time, and air while the details are fresh. Waiting even a few hours means forgetting key data.
- 2. Track your gas.** Start pressure, end pressure, and breathing rate reveal your air consumption trends and help you plan future dives.
- 3. Record conditions.** Water temperature, visibility, current, and surge affect every dive. Note what gear configuration worked best.
- 4. Note the wildlife.** The creatures you encounter make each dive unique. From reef fish to pelagics, your log becomes a marine life journal.
- 5. Reflect on skills.** What went well? What needs improvement? Buoyancy, navigation, air management — track your growth as a diver.

Pro Tip: Use a waterproof dive slate underwater to note depth, time, and air. Transfer the data to your log book on the surface.

Dive Safety Essentials

Plan the dive, dive the plan

Plan Your Dive

Agree on max depth, bottom time, and air turn-around point with your buddy before entering the water.

Buddy System

Stay close to your buddy. Perform buddy checks before every dive — BCD, Weights, Releases, Air, Final check.

Ascend Slowly

Never exceed 30 feet (9 meters) per minute. A safety stop at 15 feet for 3 minutes is mandatory on every dive deeper than 30 feet.

Monitor Your Air

Check your pressure gauge frequently. Turn the dive when you reach the agreed reserve — typically 500 psi / 50 bar.

Equalize Early

Equalize your ears before feeling discomfort. If you cannot equalize, ascend slightly and try again. Never force it.

Dive Within Your Limits

Stay within your certification level. If something feels wrong, call the dive. Any diver can end a dive at any time for any reason.

Remember: *This log book is a personal record. It does not replace proper training. Always follow your certifying agency's standards and local diving regulations.*

Types of Diving

Know your dive environments

Reef Dive	The most popular recreational dive. Explore coral gardens teeming with marine life. Depths typically 15-80 feet.
Wall Dive	Follow a vertical drop-off into the deep blue. Spectacular visibility and pelagic encounters. Watch your depth gauge closely.
Wreck Dive	Explore sunken ships, planes, and artificial reefs. Requires additional training for penetration. Rich in history and marine life.
Drift Dive	Float with the current while the boat follows. Effortless and exhilarating. Requires a surface marker buoy (SMB).
Night Dive	Experience the underwater world after dark. Different marine life emerges. Requires a primary dive light and backup.
Cavern/Cave Dive	Explore overhead environments. Requires specialized cave diving certification. Always maintain a continuous guideline to the surface.
Deep Dive	Beyond 60 feet (18m). Requires deep diver specialty training. Shorter bottom times due to nitrogen absorption.
Shore Dive	Enter from the beach. Economical and flexible. Plan your exit point and tide conditions carefully.

Essential Hand Signals

Silent communication underwater

OK

Touch thumb and index finger to form a circle. Used both on surface and underwater.

Stop / Hold

Palm facing outward, fingers up. Signal to stop and hold position.

Go Up / Ascend

Thumb up. Signal that you or the group should ascend.

Go Down / Descend

Thumb down. Signal to descend or go deeper.

Out of Air

Hand slashing across the throat. Emergency signal — buddy must share air immediately.

Low on Air

Clenched fist moved in a cutting motion across the chest. Signal that air supply is running low.

How Much Air?

Fingers and thumb tapping together. Asking buddy to show their pressure gauge.

Something Wrong

Flat hand waved side to side, palm down. Followed by pointing to the problem area.

Look at Me

Point two fingers at own eyes. Direct buddy's attention to you.

Danger / Hazard

Closed fist. Used to warn of danger or signal buddy to pay attention.

Signal Tip: Always respond to a signal — even a simple "OK" back confirms you saw and understood. Underwater communication is a two-way agreement.

Understanding Air Consumption

Track your breathing rate to dive smarter

WHY TRACK YOUR AIR?

Your breathing rate (Surface Air Consumption, or SAC rate) is one of the most important personal metrics in diving. Knowing your SAC helps you plan dive times, choose the right cylinder, and dive with confidence. It varies with depth, exertion, stress, and experience.

How to Calculate SAC Rate

SAC (psi/min) = Air Used (psi) ÷ Bottom Time (min) ÷ Pressure at Depth (ATA)

Example: You start with 3000 psi, finish with 1000 psi after a 40-minute dive at an average depth of 33 feet (2 ATA).

Air used = 3000 – 1000 = 2000 psi
SAC = 2000 ÷ 40 ÷ 2 = **25 psi/min**

Typical SAC Rates

EXPERIENCE LEVEL	SAC RATE (PSI/MIN)	SAC RATE (L/MIN)
Beginner	25-35	20-28
Intermediate	20-28	16-22
Experienced	15-22	12-18
Expert / Technical	12-18	10-15

Track Your Progress: Record start pressure, end pressure, depth, and bottom time for every dive. Over time, you will see your SAC rate improve as your buoyancy and relaxation underwater get better.
