How to Use This Journal

Every batch is a learning opportunity

WHY DOCUMENT YOUR SOAP?

Soap making is both art and science. A single degree change in temperature, a different oil ratio, or a new fragrance oil can transform your results. Without records, you cannot reproduce your best batches or learn from the ones that failed. This journal turns every batch into accumulated expertise.

Tips for Better Soap Records

- 1. Weigh everything.** Soap making requires precision. Use a digital scale accurate to 0.1 oz or 1 gram. Record actual weights, not just percentages. Volume measurements (cups, spoons) are not accurate enough.
- 2. Note temperatures.** Record the temperature of your oils and lye solution at trace. Temperature affects saponification speed, color, and texture. Ideal range is typically 90-110°F for cold process.
- 3. Time your trace.** Record how long it took to reach trace and what kind of trace (thin, medium, thick). This reveals how oils, fragrances, and temperatures affect your formula.
- 4. Track cure time and results.** Test bars at 2, 4, and 6 weeks. Note hardness, lather quality, scent strength, and skin feel. A soap that seems harsh at 2 weeks may be perfect at 6.
- 5. Photograph every batch.** Cut bars and photograph cross-sections. Record a reference photo number in your journal. Colors and patterns are hard to describe in words.
- 6. Record failures honestly.** Ricing, seizing, acceleration, DOS (dreaded orange spots), and lye-heavy batches happen to everyone. Documenting the cause prevents repeating mistakes.

Oil Properties Guide

How common oils contribute to your soap

OIL / FAT	HARD	CLEANS	COND.	BUBBLY	CREAMY	SAP NAOH
Olive Oil	15	0	82	0	22	.135
Coconut Oil	68	67	12	46	22	.183
Palm Oil	58	1	49	1	50	.142
Palm Kernel	70	63	15	43	29	.176
Shea Butter	40	0	62	0	40	.133
Cocoa Butter	50	0	56	0	44	.137
Castor Oil	2	9	90	64	26	.129
Sunflower Oil	11	2	63	2	19	.135
Sweet Almond	12	3	59	3	18	.137
Avocado Oil	12	3	60	3	18	.134
Lard	41	0	53	0	47	.141
Tallow (Beef)	54	9	47	9	45	.144
Hemp Seed	6	4	50	4	14	.137
Jojoba (wax)	0	0	0	0	0	.069

Values are approximate ranges from typical fatty acid profiles. Hard = bar hardness, Cleans = cleansing power, Cond. = conditioning, Bubbly = fluffy lather, Creamy = stable creamy lather. SAP = mg NaOH per gram of oil. Always verify with a lye calculator before making soap.

Lye Safety Guidelines

Essential safety for working with sodium hydroxide

THE MOST IMPORTANT RULE

Always add lye to water. Never add water to lye. Adding water to lye causes a violent exothermic reaction that can boil, splash, and cause severe chemical burns. Memorize: "Snow falls on the lake."

Personal Protection

1. Safety goggles (not glasses) at all times when handling lye. Lye in eyes causes permanent blindness.
2. Long rubber or nitrile gloves. Lye burns skin on contact.
3. Long sleeves, pants, and closed-toe shoes. Protect all skin.
4. Keep vinegar nearby for skin contact (neutralizes alkaline burn). Rinse with water first, then vinegar.
5. Work in a well-ventilated area. Lye fumes are harmful. Never lean over the lye solution.

Equipment

6. Use only stainless steel, heat-safe glass, or heavy plastic for lye. Never use aluminum (reacts violently) or copper.
7. Dedicated soap-making equipment only. Do not reuse pots, spoons, or containers for food.
8. Use an immersion blender dedicated to soap making. Clean all equipment thoroughly after use.
9. Digital scale accurate to 0.1 oz or 1 gram. Precision is non-negotiable.

Mixing Lye Solution

10. Weigh lye and water separately. Always add lye to water, never reverse.
11. Stir slowly with a heat-safe spatula. Solution reaches 200°F+ instantly.
12. Let solution cool to 90-110°F before mixing with oils. Track temperature.
13. Label and store lye containers clearly. Keep away from children and pets.
14. Clean spills immediately with paper towels, then wash with water and vinegar.

Fragrance Guide

Scenting your soap safely and effectively

ESSENTIAL OIL	USAGE RATE	BEHAV.	NOTES
Lavender	0.5-1 oz/lb	Stable	Reliable, versatile. Survives saponification well. Floral-herbal.
Peppermint	0.3-0.5 oz/lb	Stable	Cooling sensation on skin. Strong scent. Use less for face soap.
Sweet Orange	0.5-1 oz/lb	Var.	Citrus oils fade faster. Use 1 oz/lb minimum. Uplifting scent.
Lemon	0.5-1 oz/lb	Var.	Fades in cure. Consider lemon peel powder for lasting scent.
Tea Tree	0.3-0.5 oz/lb	Stable	Antibacterial, medicinal scent. Good for acne-prone skin.
Eucalyptus	0.3-0.5 oz/lb	Stable	Refreshing, decongestant. Strong camphor scent.
Rosemary	0.3-0.5 oz/lb	Stable	Herbal, stimulating. Pairs well with peppermint.
Cedarwood	0.5-0.8 oz/lb	Stable	Earthy, woody. Base note. Very stable in soap.
Patchouli	0.5-0.8 oz/lb	Stable	Deep earthy scent. Fixative — helps hold other scents.
Litsea Cubeba	0.5-1 oz/lb	Stable	"Mountain pepper." Strong lemon scent that lasts longer than lemon EO.
Clary Sage	0.3-0.5 oz/lb	Stable	Herbal-floral. Relaxing. Pairs with lavender.
Ylang Ylang	0.3-0.5 oz/lb	Var.	Exotic floral. Can accelerate trace slightly. Use at light trace.

FRAGRANCE OIL BEHAVIOR IN CP SOAP

BEHAVIOR	WHAT IT MEANS
Stable	No effect on trace. Easy to work with. Ideal for beginners.
Accelerates	Causes trace to thicken quickly. Work fast. Mix at lower temperature.
Rices	Causes lumpy, grainy texture in batter. Usually from vanilla or floral FOs.
Seizes	Batter turns solid instantly. Very difficult to save. Test new FOs in small batches.
Discolors	Turns soap tan, brown, or dark over time. Vanilla content is common cause.

Curing Your Soap

Patience makes perfect bars

WHY CURE?

Fresh soap contains excess water and the saponification process is not fully complete. Curing allows water to evaporate (making bars harder and longer-lasting) and lets the pH settle. A well-cured bar is milder, harder, and lathers better. Rush this step and you get soft, dissolving, harsh bars.

TIMELINE	WATER LOSS	WHAT TO CHECK
Week 1	~5-8%	Bars are still soft. Keep in mold first 24-48 hrs, then cut. Place on curing racks with airflow.
Week 2	~10-15%	Bars firming up. Test for hardness with thumbnail press. Should leave slight indent.
Week 4	~15-20%	Bars feel hard. Initial lather test. Scent should be noticeable. pH should test below 10.
Week 6	~20-25%	Standard cure complete for most recipes. Good lather, mild feel, lasting bar.
Week 8+	~25-30%	Extended cure for high-olive recipes. Even milder, denser lather. Bars last longest.

CURING BEST PRACTICES

FACTOR	IDEAL
Airflow	Open shelving or racks. Fans circulating air. No sealed containers.
Humidity	Low (under 50% if possible). Use dehumidifier in damp climates.
Temperature	Room temperature (65-75°F). Avoid extreme heat or cold.
Spacing	Bars not touching. At least 0.5 inch between for airflow.
Light	Avoid direct sunlight (causes fading and DOS). Dark or dim storage.
Turning	Flip bars every few days for even drying on all sides.

TESTING YOUR SOAP

TEST	WHAT TO LOOK FOR
Zap Test	Lick the soap. A "zap" or tingle = lye-heavy, not ready. No zap = safe to use.
pH Strip	Wet soap surface, press pH strip. Readings 8-10 are normal for soap. Above 11 = uncured.
Lather	Wash hands. Check for bubbly vs creamy lather, how it rinses, skin feel after.
Hardness	Press thumbnail into bar. Hard, slight give = good. Soft, crumbly = keep curing.

Common Soap Problems

Identify and fix batch issues

PROBLEM	LIKELY CAUSE	SOLUTION
Seize	Fragrance oil reacts instantly. Temperature too high. FO not CP-safe.	Work at lower temp. Test FO in small batch. Switch FO. Use hot process.
Acceleration	FO/EO speeds trace. Stearic acid, hard butters. Temp too high.	Lower oil/lye temps. Add FO at very light trace. Work fast.
Ricing	FO forms rice-like lumps in batter. Common with floral FOs.	Stick blend vigorously to incorporate. May incorporate or need straining.
DOS (Orange Spots)	Oil rancidity. Old oils, high superfat, humidity during cure.	Use fresh oils. Add ROE or vitamin E. Lower superfat. Cure in low humidity.
Lye Heavy	Mismeasured lye. Wrong SAP values. Scale error. Insufficient cure.	Always verify with lye calculator. Zap test before use. Recalculate recipe.
Soda Ash	Lye reacts with air CO2 on surface. Uncovered during saponification.	Spray with rubbing alcohol after pour. Cover with plastic wrap. Steam or wash off.
Gel Partial	Uneven temperature during saponification. Center gels, edges do not.	Insulate mold fully. Force gel phase (oven process). Or embrace ungelled look.
Cracking	High lye concentration. Too much coconut oil. Temperature shock.	Use more water. Reduce coconut oil. Control temperatures.
Color Fade	UV light exposure. Unstable colorant. High pH destroying pigment.	Use stable pigments (oxides, micas). Store dark. Avoid plant colorants.
No Scent	Insufficient EO/FO. Citrus oils fading. Volatile oils evaporating.	Increase usage rate. Use stable oils (patchouli, litsea). Seal cure area.
Soft Bars	High water. High soft oil ratio. Not fully cured. High superfat.	Cure longer. Reduce water. Increase hard oils (palm, cocoa butter).
