

Sourdough Baking Log

Every Loaf Tells a Story

MORE SHINE PRESS

Your Sourdough Journey

This log is your companion for mastering sourdough bread. Every loaf teaches you something — about your starter, your flour, your environment, and your hands. Capture each bake here and watch your bread improve.

The Bake Spread

Each bake uses a **two-page spread**. The left page records the formula and process: starter details, flour blend, hydration, salt percentage, levain build, bulk fermentation time and temperature, proof schedule, and bake parameters. The right page captures the results: crumb description, crust evaluation, flavor notes, and what to improve next time.

Key Measurements

- **Hydration** = $\text{Water weight} \div \text{Flour weight} \times 100$.
- **Salt Pct** = $\text{Salt weight} \div \text{Flour weight} \times 100$ (typically 2%).
- **Levain Pct** = $\text{Levain weight} \div \text{Flour weight} \times 100$ (typically 10–20%).
- Weigh everything in **grams**. Volume measurements are not accurate enough for bread.

Temperature Matters

Dough temperature is the single most important variable in sourdough. Warmer dough ferments faster; cooler dough ferments slower. Most formulas target a dough temperature of 75–78°F (24–26°C) after mixing. Always record your ambient temperature and dough temperature.

THE SOURDOUGH PROCESS

STAGE	WHAT HAPPENS
Levain	Build a small offshoot of your starter with fresh flour and water. Usually 4–6 hours before mixing.
Autolyse	Mix flour and water only. Rest 30–60 min. Gluten develops, flour hydrates.
Mix	Add levain and salt to the autolysed dough. Pinch and fold to incorporate.
Bulk Ferment	4–6 hours at 75–78°F. Perform stretch-and-folds every 30–60 min for the first 2–3 hours.
Shape	Preshape, rest 20 min, then final shape into a boule or batard. Tension on the surface.
Cold Proof	Refrerate 12–18 hours at 37–39°F. Develops flavor, makes scoring easier.
Bake	Preheat Dutch oven 500°F. Bake covered 20 min, then uncovered 20–25 min at 450°F.

 Signs of Good Fermentation

- Dough increases 30–50% in volume during bulk.
- Surface looks smooth and slightly domed.
- Bubbles visible on edges and surface.
- Dough feels light and airy, not dense.
- Jiggles when gently shaken.

— UNDERSTANDING THE FORMULA —

In baker's percentages, **flour is always 100%**. Every other ingredient is expressed as a percentage of the flour weight. This lets you scale any formula up or down.

👉 **Standard Sourdough Formula**

INGREDIENT	%	FOR 500G FLOUR
Bread Flour	100%	500 g
Water	75%	375 g
Levain	20%	100 g
Salt	2%	10 g

👉 **Scaling Example**

To make a larger loaf with 600g flour:

Water = $600 \times 0.75 = 450$ g

Levain = $600 \times 0.20 = 120$ g

Salt = $600 \times 0.02 = 12$ g

👉 **Common Hydration Ranges**

65–70% = Stiff dough, easier to shape, tighter crumb.

70–78% = Standard sourdough, balanced handling.

78–85% = High hydration, open crumb, harder to handle.

85%+ = Very slack dough, ciabatta-style, requires skill.

COMMON FLOUR TYPES

FLOUR	CHARACTERISTICS
Bread Flour	12-13%% protein. High gluten. Best for structured loaves with good oven spring.
All-Purpose	10-12%% protein. Works for sourdough but slightly weaker. Good for beginners.
Whole Wheat	13-14%% protein. Nutty, dense. Use 10-30%% of blend — too much weakens gluten.
Rye	8-9%% protein. Low gluten. Adds flavor and ferments fast. Use 5-15%% of blend.
Spelt	12-14%% protein. Tender gluten. Subtle sweet flavor. Substitute up to 50%%.
Einkorn	14-18%% protein. Ancient wheat. Weak, sticky gluten. Needs gentle handling.

 Protein and Gluten

Higher protein flour absorbs more water and develops stronger gluten. If you switch from all-purpose to bread flour, you may need to increase hydration by 2–5% to get the same dough feel.

 Whole Grain Adjustments

Whole wheat and rye absorb more water than white flour. When adding whole grains, increase hydration by 2–5%. Whole grains also speed up fermentation — watch your bulk time.

HYDRATION & DOUGH FEEL

HYDRATION	DOUGH FEEL & RESULT
60–65%	Stiff, easy to handle. Tight, even crumb. Good for sandwich loaves.
65–70%	Manageable, slightly tacky. Reliable for beginners. Moderate crumb.
70–75%	Soft, slightly sticky. Classic artisan texture. Good oven spring.
75–80%	Soft and sticky. Open, irregular crumb. Requires coil folds.
80–85%	Very slack, spreads easily. Large open holes. Advanced technique.
85%+	Almost batter-like. Ciabatta and focaccia territory. Very skilled.

👉 Adjusting Hydration

Start at 72% if you are new to sourdough. Once you can consistently shape and bake good loaves, increase by 2–3% per bake to push toward more open crumb. If dough is too sticky to shape, drop hydration back.

👉 Humidity Factor

In humid environments, flour already contains moisture. You may need to reduce water by 1–2%. In dry environments, you may need a touch more.

— TWO-DAY SOURDOUGH SCHEDULE —

WHEN	ACTION
Day 1 8:00 AM	Feed starter. Wait until it has doubled and passes the float test.
Day 1 12:00 PM	Build levain (10-20g starter + 50g flour + 50g water).
Day 1 4:00 PM	Levain is ready. Begin autolyse: mix flour + water only.
Day 1 5:00 PM	Add levain and salt to autolysed dough. Pinch to incorporate.
Day 1 5:30 PM	First set of stretch-and-folds. Then every 30-45 min.
Day 1 9:00 PM	Bulk ferment continues. Watch for 30-50% volume growth.
Day 1 10:00 PM	Divide and shape. Place in banneton, cover well.
Day 1 10:30 PM	Into the fridge for cold proof. 12-18 hours.
Day 2 8:00 AM	Preheat Dutch oven in oven at 500°F for 1 hour.
Day 2 9:00 AM	Score and bake. Covered 20 min, uncovered 20-25 min.
Day 2 9:45 AM	Bread is done. Cool completely on wire rack (2+ hours).

Times are approximate for 75–78°F dough temperature. In winter, everything takes longer; in summer, shorter. Adjust accordingly.

SOURDOUGH GLOSSARY

Autolyse Resting flour and water together before adding levain and salt. Develops gluten and improves flavor.

Banneton A proofing basket (often cane or wood) that supports shaped dough during cold proof. Leaves a spiral pattern.

Batard An oblong loaf shape. Easier to slice for sandwiches than a round boule.

Boule A round ball-shaped loaf. The most classic sourdough shape.

Bulk Ferment The first and longest rise, after mixing and before shaping. Where most flavor develops.

Cold Proof Refrigerating shaped dough for 12-18 hours. Develops flavor and makes scoring easier.

Crumb The interior texture of the bread. Open crumb = large irregular holes. Tight crumb = small even holes.

Ear The raised flap of crust where the dough was scored. A sign of good oven spring and technique.

Grigne The cut or burst in the crust created by scoring. French for "grin."

Hydration The ratio of water to flour, expressed as a percentage. Higher hydration = softer, stickier dough.

Levain A small build of starter, flour, and water used to leaven the dough. Different from the maintenance starter.

Oven Spring The rapid rise of dough in the first 10 minutes of baking, caused by steam and yeast activity.

Retard Slowing fermentation by refrigerating the dough. Also called cold proof or cold retard.

Scoring Cutting the dough surface before baking to control where it expands. Done with a razor (lame).

Stretch & Fold A gentle kneading method: grab dough, stretch up, fold over. Repeated several times during bulk.

Windowpane Test Stretching a small piece of dough thin enough to see light through. Tests gluten development.
